## SKU:SEN0335 (https://www.dfrobot.com/product-2064.html)

(https://www.dfrobot.com/product-2064.html)

### Introduction

Build up a simple environmental monitor station with this multi-function environment sensor! Based on the combination of CCS811+BME280 chip, this module features high accuracy, IIC interface and fast Measurement. The BME280 can provide temperature and humidity compensation for CCS811 to improve the whole accuracy to a certain extent. It can be used to detect temperature, humidity, barometric pressure, altitude, TVOC and eCO2.

CCS811 air quality sensor uses AMS's unique micro-hot plate technology. Compared with conventional gas sensors, it has lower power consumption, shorter preheating time, and smaller size. The internally integrated ADC and MCU allow it to collect and process data, and return via 12C.

BME280 is an environmental sensor that combines temperature sensor, humidity sensor and barometer in one board. It has high precision, multiple functions, small size, etc. The sensor offers ±0.5°C temperature error and ±2%RH humidity error. It provides very stable performance within the detection temperature range. Besides, the offset temperature coefficient is ±1.5 Pa/K, equiv. to  $\pm 12.6$  cm at 1 °C temperature change.

**NOTE**: The chip has stretched the clock in I2C. So, it may be not compatible with some controllers, such as Raspberry Pi.

The following table shows the effects of carbon dioxide and TVOC on the human body.

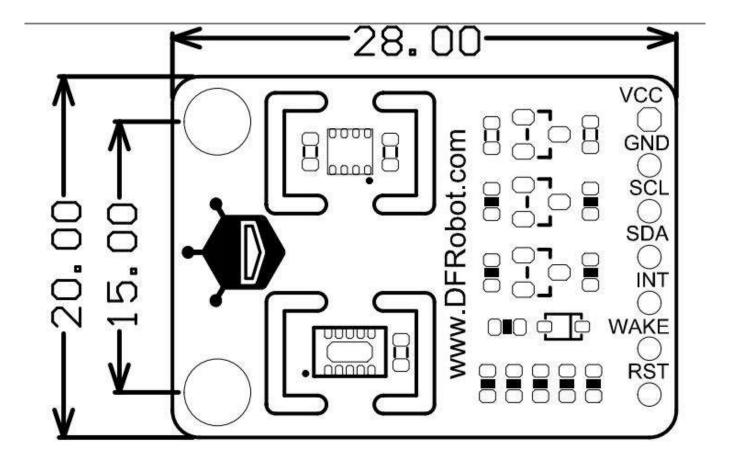

Carbon Dioxide சூழு Dioxide (PPM)	Effect on Effect on Human	EVICEntration  (PPB)	Effect on Human Effect on Human
		(FFD)	

<500	Normal	<50	Normal
500-1000	A little uncomfortable	50-750	Anxious, uncomfortable
1000-2500	Tired	750-6000	depressive, headache
2500-5000	Unhealthy	>6000	headache and other nerve problems

# **Applications**

- Environment Monitor
- Air Purifiers
- Smart Home
- Ventilation System
- Weather Forecast

# **Specification**

Operating Voltage: 3.3V~5.5 V

• Working Current: <20mA

#### **CCS811 Parameter:**

Preheat Time: <15s</li>

• I2C Address: 0x5A(in default)/0X5B

Operating Temperature Range: -40°C~85°C

• Operating Humidity Range: 10%RH~95%RH

• eCO2 Measuring Range: 400ppm~8000ppm

• TVOC Measuring Range: 0ppb~1100ppb

#### **BME280 Parameter:**

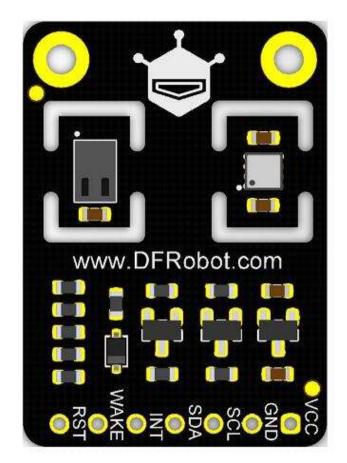

• I2CAddress: 0x76(in default)/0X77

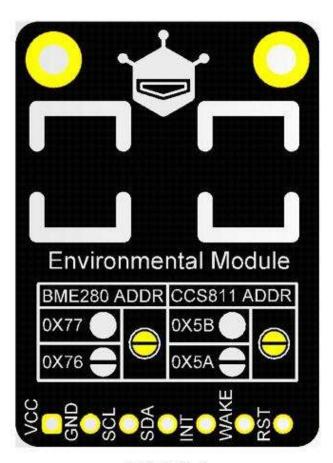

• Operating Temperature: -40°C~85°C

- Temperature Measuring Range: -40°C~+85°C, resolution of 0.1°C, deviation of ±0.5°C
- Humidity Measuring Range: 0~100%RH, resolution of 0.1%RH, deviation of ±2%RH

• Pressure Measuring Range: 300~1100hPa

# **Board Overview**

TOP BOTTOM

Num	Label	Description
1	VCC	+
2	GND	-
3	SCL	IIC clock line
4	SDA	IIC data line
5	INT	Interrupt pin: interrupt in low level
6	WAKE	Switch pin: awake in low level / sleep in high level
7	RST	Reset pin: reset in low level

# **Tutorial**

This sensor adopts Gravity I2C interface, so it is easy to use. Connect the sensor to Uno baord as the way shown below.

The product warm-up time is short, accurate readings can be made quickly once powered up. The read time can be shortened by setting the environmental baseline (the baseline acquisition and setup method are explained below; for more details about baseline, go to the end of the wikipage to find the related document).

NOTE: Please run the sensor for 48hours when using it for the first time.

### Requirements

#### Hardware

- o DFRduino UNO R3 (https://www.dfrobot.com/product-838.html) (or similar) x 1
- Multi-function environmental Module CCS811+BME280 x 1
- Jumper wires

#### Software

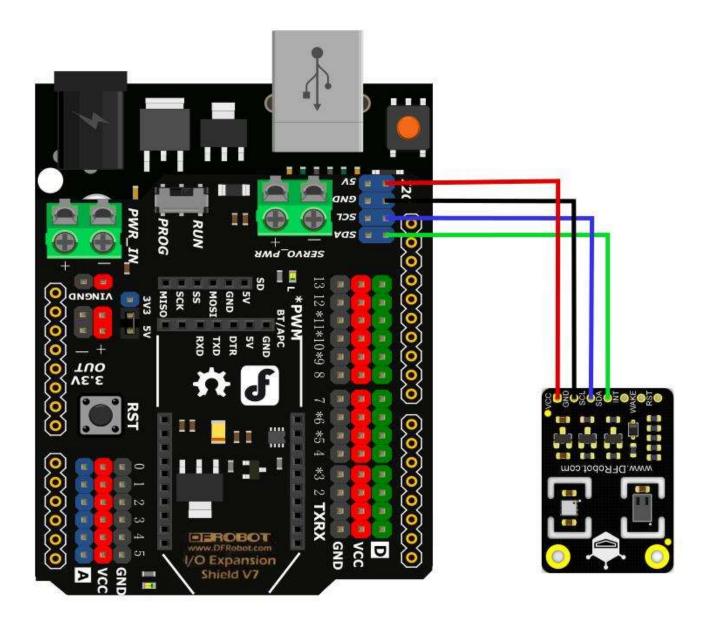

- Arduino IDE (https://www.arduino.cc/en/Main/Software)
- Download and install the CCS811 Library and examples (https://github.com/DFRobot/DFRobot\_CCS811).
- Download and install the BME280 Library and examples
   (https://github.com/DFRobot/DFRobot\_CCS811) (About how to install the library?
   (https://www.arduino.cc/en/Guide/Libraries#.UxU8mdzF9H0))

#### About API Function List

```
/************************************/
/**

 * @return Altitude in meter
float calAltitude(float seaLevelPressure, uint32 t pressure);
```

### **Connection Diagram**

### 1. Get Baseline

### Why should we get the baseline?

Why should we get the baseline? Because once get it, we can show the air quality quickly after the sensor warm-up by inputting the baseline. Otherwise, it will cost a long time to read correctly when startup in polluted air.

During the first week of running the sensor, it is recommended to save a new baseline every 24 hours. After 1 week of operation, it can be saved every 1-28 days

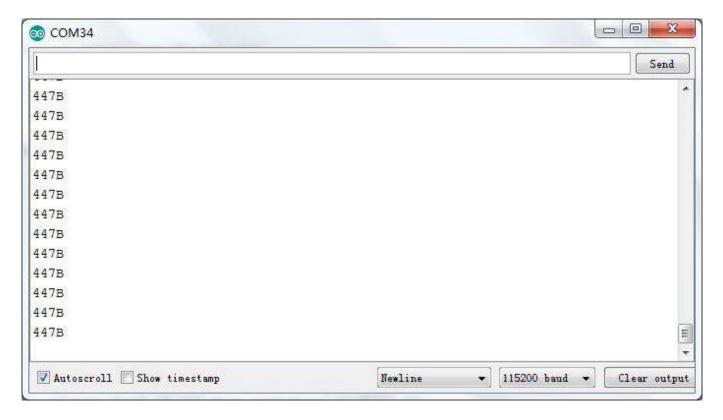

### NOTE:

- Please place it in a fresh air environment (20 minutes or more) to obtain the baseline.
- Different sensors, different measurement cycles have different baselines.

```
/*!
 * @file getBaseLine.ino
 * @brief Put the module in clear air and work a few minutes, wait for baseline doing not
 * @n Experiment phenomenon: get
 * @copyright
                 Copyright (c) 2010 DFRobot Co.Ltd (https://www.dfrobot.com)
 * @licence
                The MIT License (MIT)
 * @author [LuoYufeng](yufeng.luo@dfrobot.com)
 * @version V0.1
 * @date 2019-07-19
 * @https://github.com/DFRobot/DFRobot_CCS811
 */
#include "DFRobot_CCS811.h"
 * IIC address default 0x5A, the address becomes 0x5B if the ADDR SEL is soldered.
//DFRobot_CCS811 sensor(&Wire, /*IIC_ADDRESS=*/0x5A);
DFRobot_CCS811 sensor;
void setup(void)
{
    Serial.begin(115200);
    /*Wait for the chip to be initialized completely, and then exit*/
    while(sensor.begin() != 0){
        Serial.println("failed to init chip, please check if the chip connection is fine'
        delay(1000);
    }
    /**
     * @brief Set measurement cycle
     * @param cycle:in typedef enum{
                        eClosed,
                                      //Idle (Measurements are disabled in this mode)
                        eCycle 1s,
                                      //Constant power mode, IAQ measurement every second
                        eCycle_10s, //Pulse heating mode IAQ measurement every 10 secon
                                     //Low power pulse heating mode IAQ measurement ever
                        eCycle 60s,
                        eCycle_250ms //Constant power mode, sensor measurement every 250
                        }eCycle_t;
     */
    sensor.setMeasCycle(sensor.eCycle_250ms);
void loop() {
    if(sensor.checkDataReady() == true){
        /*!
         * @brief Set baseline
```

After a while, the baseline reaches to a stable value.

### 2. Get Data

Input the baseline value to the function <code>sensor.writeBaseLine()</code>; If you don't want to set the baseline, please disable this function in the sample program. The sensor will automatically calibrate the baseline, but it would be a pretty long process. after the function uploaded to UNO, open the serial port monitor to check the carbide dioxide concentration and TVOC concentration.

```
/*!
 * @file readData.ino
 * @brief Read the concentration of carbon dioxide and TVOC
 * @n Experiment phenomenon: read data every 0.5s, and print it out on serial port.
 * @copyright
                Copyright (c) 2010 DFRobot Co.Ltd (https://www.dfrobot.com)
 * @licence
               The MIT License (MIT)
 * @author [LuoYufeng](yufeng.luo@dfrobot.com)
 * @version V0.1
 * @date 2019-07-19
 * @https://github.com/DFRobot/DFRobot_CCS811
 */
#include "DFRobot_CCS811.h"
/*
 * IIC address default 0x5A, the address becomes 0x5B if the ADDR_SEL is soldered.
//DFRobot CCS811 sensor(&Wire, /*IIC ADDRESS=*/0x5A);
DFRobot CCS811 sensor;
void setup(void)
{
    Serial.begin(115200);
    /*Wait for the chip to be initialized completely, and then exit*/
    while(sensor.begin() != 0){
        Serial.println("failed to init chip, please check if the chip connection is fine'
        delay(1000);
    }
    /**
     * @brief Set measurement cycle
     * @param cycle:in typedef enum{
                        eClosed,
                                    //Idle (Measurements are disabled in this mode)
                        eCycle 1s, //Constant power mode, IAQ measurement every second
                        eCycle 10s, //Pulse heating mode IAQ measurement every 10 secor
                        eCycle_60s, //Low power pulse heating mode IAQ measurement ever
                        eCycle 250ms //Constant power mode, sensor measurement every 250
                        }eCycle t;
    sensor.setMeasCycle(sensor.eCycle 250ms);
void loop() {
    if(sensor.checkDataReady() == true){
        Serial.print("CO2: ");
        Serial.print(sensor.getCO2PPM());
        Serial.print("ppm, TVOC: ");
```

```
Serial.print(sensor.getTVOCPPB());
Serial.println("ppb");

} else {
    Serial.println("Data is not ready!");

}

/*!
  * @brief Set baseline
  * @param get from getBaseline.ino
  */
sensor.writeBaseLine(0x447B);
//delay cannot be less than measurement cycle
delay(1000);
}
```

### 3. Concentration Alarm

Input the baseline value to the function sensor.writeBaseLine(); Upload it to UNO, when the CO2 concentration moves from the current range (low, medium, high) to another range (more than 50 ppm), an interruption is generated and the current CO2 value will be printed.

NOTE: This example requires the INT pin of the sensor to be connected to the corresponding interrupt pin on the main board (in the sample, D2 of UNO is selected).

### **AVR Series Interrupt Pin and Interrupt Number**

	Band/lainbioards: Uno,	Mega2560 Mega2560	Bearlaimboards:
Interrupt	Nano, Mini	D2, D3, D21, D20,	Leonardo
Pin	D2, D3	D19, D18	D3, D2, D0, D1, D7

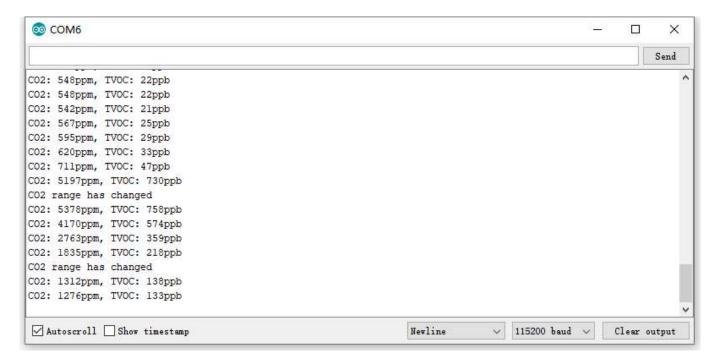

Interrupt Number	0, 1	0, 1, 2, 3, 4, 5	0, 1, 2, 3 ,4
---------------------	------	------------------	---------------

```
/*!
 * @file setInterrupt.ino
 * @brief Set interrupt parameter, when CO2 concentration range changes, get an interrupt
 * @n Experiment phenomenon: read data every 1s, and print it out on serial port.
 * @copyright
                Copyright (c) 2010 DFRobot Co.Ltd (https://www.dfrobot.com)
 * @licence
               The MIT License (MIT)
 * @author [LuoYufeng](yufeng.luo@dfrobot.com)
 * @version V1.0
 * @date 2019-07-13
 * @https://github.com/DFRobot/DFRobot_Sensor
 */
#include "DFRobot_CCS811.h"
volatile int8_t GPIO1TRIG = 0;
 * IIC address default 0x5A, the address becomes 0x5B if the ADDR SEL is soldered.
//DFRobot_CCS811 sensor(&Wire, /*IIC_ADDRESS=*/0x5A);
DFRobot_CCS811 sensor;
void setup(void)
    Serial.begin(115200);
    /*wait for the chip to be initialized completely, and then exit*/
    while(sensor.begin() != 0){
        Serial.println("failed to init chip, please check if the chip connection is fine'
        delay(1000);
    attachInterrupt(0, interrupt, RISING);
    sensor.setMeasurementMode(1, 1, sensor.eMode4);
     * @brief Set interrupt thresholds
     * @param lowToMed: interrupt triggered value in range low to middle
     * @param medToHigh: interrupt triggered value in range middle to high
     */
    sensor.setThresholds(1500,2500);
void loop() {
    if(GPIO1TRIG == 1){
        Serial.println("CO2 range has changed");
        Serial.print("CO2: ");
        Serial.print(sensor.getCO2PPM());
        Serial.print("ppm, TVOC: ");
```

```
Serial.print(sensor.getTVOCPPB());
Serial.println("ppb");
delay(1000);
}
GPIO1TRIG = 0;
Serial.print("CO2: ");
Serial.print(sensor.getCO2PPM());
Serial.print("ppm, TVOC: ");
Serial.print(sensor.getTVOCPPB());
Serial.println("ppb");
sensor.writeBaseLine(0x847B);
delay(1000);
}

void interrupt(){
GPIO1TRIG = 1;
}
```

When you blow air to the sensor, the range of CO2 concentration changes, which results in an interruption; when the gas concentration decreases, there is also an interruption.

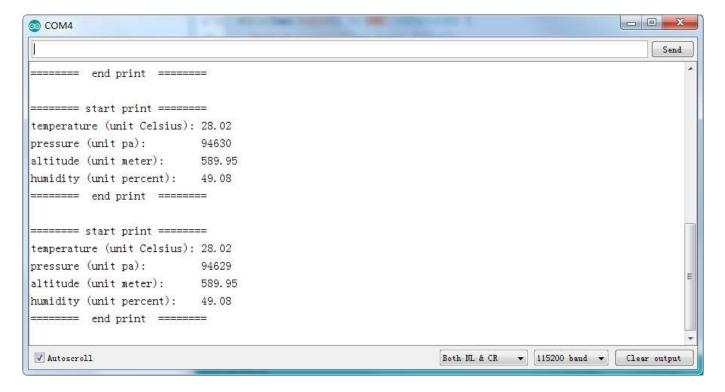

### 4. BME280 Read Data

Note: please check the IIC address of BME280 in the program before using. Chip initialization will fail when the hardware IIC address is not the same as the address in the codes.

Run the codes, then the related data will be printed.

```
/*!
 * raed data i2c.ino
 st Download this demo to test read data from bme280, connect sensor through IIC interface
 * Data will print on your serial monitor

 Serial.println();
 Serial.println("====== start print ======");
 Serial.print("temperature (unit Celsius): "); Serial.println(temp);
                                     "); Serial.println(press);
 Serial.print("pressure (unit pa):
 Serial.print("altitude (unit meter):
                                         "); Serial.println(alti);
 Serial.print("humidity (unit percent): "); Serial.println(humi);
 Serial.println("====== end print ======");
 delay(1000);
}
```

### **FAQ**

Q: Why the sensor init failed and the serial monitor printed "device not detected"?

A: Check whether the IIC address in the codes is the same as the sensor address.
